## GSF - bellow coupling: introduction

- Hubs made in aluminum fully turned and bellow in stainless steel.
- Suitable for applications with high temperatures (>300 ${ }^{\circ} \mathrm{C}$ ).
- High torsional rigidity and low inertia.
- Wear and maintenance free.

O Backlash free for precision and high speeds.
O Single split clamp hub (type B) and finished bore in ISO H8 tollerance and low roughness.

## ON REQUEST

O Single split clamp hub with bore and keyway (type B1).

- Two piece clamp hub with bore and keyway (type C1) or without keyway (type C).

O Connection to the Torque limiter's (safety coupling) range possible.

- Customised manufacturing for specific requirements.

The GSF bellow couplings have been designed and manufactured for all applications requiring excellent dynamic characteristics, necessary for high speeds, fast reversing and, at the same time, torsional rigidity with low inertia without compromising the high reliability.
The coupling is made in three different and modular elements, in order to obtain high flexibility in assembling and availability. The two shafts are connected to the bellow exploiting a simple mechanic system, easy and safe, by properly sized radial screws and without using bonding agents. In this way the coupling is able to operate and withstand high temperatures, up to $300^{\circ} \mathrm{C}$.
The coupling allows the compensation of all possible misalignments between the two shafts, to be connected in accordance to the values indicated in the table, assuring an infinite number of working cycles.

## DIMENSIONING

The coupling's nominal torque must be higher than the maximum torque of the motor shaft, according to the generic formula on page 4. For further checks it is useful to verify: inertia on acceleration / deceleration, incorrect positioning in case of application when high precision is required, the natural frequency of the application (simplified system with two masses) according to formulas:

## FITTING

It is advised to machine the connection's shafts with:

- Surface finish with $\mathrm{Ra}=1.6 \mu \mathrm{~m}$.
- Coaxial precision 0.01 mm .
- Nominal tolerance h6.

At first, assemble the coupling by inserting the bellow into the relevant hubs and tighten the screws "S2" in sequence, respecting a cross sequence, continuously until you obtain the tightening torque indicated in the catalogue. Insert one hub on the first shaft along the $N$ length and tighten the clamp locking screw "S1" with a torque wrench, respecting the tightening torque indicated on the catalogue. Leave the second shaft slides on the opposite hub along the whole N length and tighten the clamp locking screw with a torque wrench, respecting the tightening torque indicated on the catalogue.
It is important to consider that misalignments, axial, angular and parallel, must be considered paired together, as inversely proportional (one reduces when the other increases). If all types of misalignments occur, it is necessary that the sum in percentage respect to the maximum value doesn't exceed $100 \%$. If the metallic bellow is damaged, the whole coupling becomes unusable, so it is advised to be very careful in assembling and disassembling the individual components.

－ORDER EXAMPLE

－Model available only with finished bore．
－In case of GSF／DBSE model indicate the distance between shaft ends Example DBSE＝250mm
－The weights refer to the coupling with minimum bore，inertias refer to the coupling with maximum bore．
－Choice and availability of different hub connection type see pages 4 and 5.
In the case of a long DBSE combined with high speed，it may be necessary to use an intermediate shaft with bearing support．
Please consult our Technical Department．

## FLOHR - PRODUCTS OVERVIEW

## Gears

- Spiral toothed bevel gears
- Bevel gears
- Worm gears
- Spur gears
- Special gears

## Couplings

- Rigid and flexible couplings
- Frictional connections
- Drum-coupling
- Gear-couplings
- Safety couplings

Clamping technology

- Manual and pneumatic clamping solutions
- Power clamps
- Pivot units
- End effector solutions
- Linear units
- Grippers

## Sensor systems

- Incremental encoders
- Magnetic encoders
- Absolute encoders
- Electronic overspeed switches
- Electronic position switches
- Universal encoder systems
- Systems

Gear Technology

- Bevel gearboxes
- Angle-planetary gearboxes
- Worm gearboxes
- Cam drives and indexing units
- Cam components
- Special gearboxes

Friction connections

- Shrink discs
- Shaft couplings
- Flange couplings
- Locking units

## Belt drives

- V-belt and flat belt pulleys
- Flywheels
- Special pulleys
- Motor clamping systems
- Drive belts
- Customer designed castings
- Accessories

## Contract manufacturing

- Turning, milling, grinding
- Grooving and broaching
- Balancing
- Calculation and design
- Assembly
- Service and repair
